1. Grundfos DWS family

The Grundfos Domestic Water Supply (DWS) family of pumps includes:

- BMQE Constant Pressure System
- MQ Flow Based Pressure System
- Jet pumps.

This product guide offers information about each of these product lines.

DWS applications

The Grundfos DWS family includes pumps to fit most applications including:

- Constant pressure systems (BMQE)
- flow-based pressure boosting (MQ)
- rain water harvesting (MQ)
- pressure-switch-based boosting (Jet)
- suction lift (Jet).

Application	Product		
	BMQE	MQ	Jet
Constant pressure system	●	-	-
Flow-based pressure boosting	-	●	-
Rain water harvesting	-	●	-
Suction lift	-	●	●
Pressure-switch-based boosting	-	-	●

Constant pressure systems

In constant water pressure systems, only the required discharge pressure needs setting (fig. 1).

Cut-in and cut-out pressures do not play a role in this system.

Discharge pressure can be set from 40 to 100 psi, according to individual needs and piping system limitations.

Fig. 1 In a constant pressure system, pressure does not vary in relationship to consumption

Flow-based pressure boosting

With flow-based pressure boosting, the pump starts automatically when water is consumed and stops automatically when the consumption ceases. This is accomplished via a flow switch connected to a printed circuit board (PCB).

The pump will produce pressure in relation to the flow rate with any incoming pressure cumulative to the total discharge pressure (fig. 2).

Fig. 2 Flow-based pressure boosting

Rain water harvesting

Rain water harvesting is a way to store rain water for future use — for example, watering a garden. Rain water is collected from the roof of a home and collected into a storage container. Pull a suction lift using a non-collapsible suction line from the storage container or connect the inlet of the pump to a spigot at the bottom of the collection barrel for flooded suction.

Suction lift

High pressure water from the drive pipe passes through the venturi and pulls water from the well into the ejector, then pushes it up to the pump. This makes it possible to push water up to the pump from depths greater than 25 feet or to boost the output from a shallow well pump to higher pressures.

Fig. 3 Suction lift pressure boosting

Pressure-switch-based boosting

Pressure switches are used to control pump operation. These switches have a cut-in pressure and a cut-out pressure to turn the pump on and off respectively.

DWS product selection

Matching consumption and pump capacity

Selecting the right pump is a matter of matching water consumption with pump capacity. For best performance, avoid installing an undersized or oversized pump. Consumption may vary greatly depending on housing standards and lifestyle. For example, lawn sprinkler systems in the summer can increase consumption.

Pump selection

Pump selection is based on the water demand and required system head.

The water demand depends on the number of consumers connected to the system.

Head can either be expressed in feet or psi. Head refers to static head, pressure head, and friction head.

For assistance with pump selection, refer to the WebCAPS product selection program; a link to CAPS may be found on the Grundfos website.

Piping

In any water supply system, the sizing and choice of materials of the pipework has an impact on the choice of pumps and on the cost. Piping takes into account the system head as referred to in Pump Selection. Static head is the distance from the ground water level to the uppermost tap. Pressure head is the system pressure the user wants to achieve.

In most residential application this pressure is approximately 60 psi. Friction head depends on the pipe size, type and length.

When calculating friction loss remember to allow for deterioration in the piping schematic, since all water pipes will eventually become coated with rust, lime deposits, etc.

Flow velocity in the piping must be kept low as noise can occur due to turbulence in elbows and valves or from water hammer.

Fitting a pressure relief valve in the discharge piping is recommended to protect the piping from over-pressure due to system malfunction.

Pressure tanks

A pressure tank should be installed in order to minimize the number of pump starts and stops in the water supply system, and to reduce problems with water hammer in the pipework.

Tanks are included with the BMQE Constant Pressure System and the MQ. The BMQE system has an external tank. The MQ has an internal tank.

Jet pumps, however, may require the addition of a tank depending upon the application.

Pressure switches

Pressure switches are used to control pump operation. These switches have a cut-in pressure and a cut-out pressure to turn the pump on and off.

The BMQE Constant Pressure System includes a pressure transducer for constant pressure. The MQ has a built-in pressure switch. Jet pumps have an attached pressure switch.

Valves

Check valves

A check valve is a mechanical device which normally allows fluid to flow through in only one direction.

The BMQE Constant Pressure System and the MQ have built-in check valves. For suction lift applications with the MQ, a check valve (provided) is required at the inlet.

Foot Valves

A foot valve is required when pulling a suction lift (shallow or deep well) with a Jet pump. This valve is installed at the end of the suction pipe to prevent back flow. The MQ will also benefit from the use of a foot valve with suction lift applications.

Shut off valves

Shut off valves in the piping system make it possible to drain only the part of the system that needs attention or repair.

Flow control valves

Flow control valves are used in applications where a set flow (gpm) is required; for example, a shower head or an irrigation system.

Pressure reducing valves

Pressure reducing valves are used in applications where the incoming water pressure exceeds the maximum inlet pressure of the pump as is the case with the MQ and city water pressure. The pressure reducing valve (PRV) is used inline after the city water tap and before the pump to ensure a set pressure.

Pressure relief valves

This valve is a spring controlled device that can be adjusted to meet the needs of the pumping system. Pressure relief valves are used in applications where high pressure can result in damage to accessories; for example, tanks with maximum pressure ratings.

2. BMQE

Product introduction

The BMQE Constant Pressure System maintains constant water pressure under varying demand, even with multiple taps running. The BMQE is a complete pressure boosting system that includes:

- pump
- controller
- tank
- mounting brackets
- pressure sensor.

Fig. 4 Grundfos BMQE Constant Pressure System

High-quality construction and rugged design ensure low maintenance and trouble-free operation. The system is based on the time-tested technology of the Grundfos SQE constant pressure system (for submersible applications).

The pump's MSE 3 motor incorporates solid state electronics and permanent magnet motors which account for high motor efficiencies.

Variable speed is offered though frequency control via the CU 301 remote status box. The system can be set to operate at any duty point in the range between minimum and maximum performance of the pump.

The BMQE has built in safeties in the solid state electronics. The small footprint of the pump allows the system to be positioned either vertically or horizontally depending upon the application. Refer to the BMQE (previously EZ Boost) pages on our web site at www.grundfos.us.

Applications

The BMQE Constant Pressure System is suitable for:

- condos
- restaurants
- homes
- irrigation
- offices
- grocery applications
- many other boosting applications.

Pumped liquids

The BMQE Constant Pressure System is suitable for pumping water or other clean, thin, non-aggressive liquids not containing solid particles or fibers.

Features and benefits

With the Grundfos BMQE Constant Pressure System, constant pressure is as simple as a touch of a button on the accompanying CU 301 control unit.

Features

- Quick and easy installation
- ready-to-use system requires minimal space
- high user convenience (constant pressure regardless of consumption)
- easily adjustable pressure level with push button control
- continuous control and monitoring of pump operation
- integrated dry-running protection
- integrated overload protection
- integrated protection against over-voltage and under-voltage
- soft start feature.

Benefits

The BMQE Constant Pressure System automatically balances water surges and equalizes flow and pressure according to consumption.

In other words, the system maintains a constant water pressure despite varying consumption.

The pressure is registered by means of a pressure sensor and transmitted to the controller. The controller adjusts the BMQE pump performance accordingly.

How the system functions

When a tap is opened, the pressure in the tank will start to drop. The system maintains a constant pressure within the maximum pump performance despite varying water consumption.

The pressure is registered by means of the pressure sensor, which transmits a signal to the controller. The controller adjusts the pump performance accordingly to maintain constant pressure by changing the pump speed.

At low flow the pressure will drop slowly. When the pressure in the tank is 7 psi below the setpoint, the pump will start. When the pressure is 7 psi above the setpoint, the pump will stop.

Even though the BMQE controller is controlling the pressure within ± 3 psi, larger pressure variations may occur in the system.

If the consumption is suddenly changed — for example, if a tap is opened — the water must start flowing before the pressure can be made constant again. Such dynamic variations depend on the pipe work, but typically they will lie between 7 and 14 psi. If the desired consumption is higher than the quantity the pump is able to deliver at the desired pressure, the pressure follows the pump curve as illustrated in the far right of fig. 5.

A = Pressure setting

Fig. 5 System function

At large flow rates, the pressure will drop quickly and the pump will start immediately and maintain constant pressure. When the system is running, the controller makes small adjustments to the pressure to detect whether there is consumption. If there is none, the pump will simply refill the tank and stop after a few seconds.

BMQE pump

The pumps used for BMQE system are modified SQE submersible pumps. The BMQE pump is an SQE pump with an MSE 3 motor. The pump and motor are centered in the 4 inch stainless steel sleeve.

BMQE pumps are suitable for both continuous and intermittent operation for a variety of pressure boosting applications.

BMQE controller

The BMQE controller is a control and communication unit specifically developed for the BMQE booster pumps in constant pressure applications.

The controller provides:

- Full control of the BMQE pumps
- Two-way communication with the BMQE pumps
- Possibility of adjusting the pressure
- Alarm indication (LED) when service is needed
- The possibility of starting, stopping and resetting the pump simply by means of a push-button.

The controller communicates with the pump via power line communication, meaning that no extra cables are required between the controller and the BMQE pump.

The controller incorporates external signal input for pressure sensor and a pump status relay for use with devices dependant on pump status.

BMQE motor

The MSE 3 motors are based on state-of-the-art technology within permanent magnets (PM motor), which accounts for the high motor efficiencies. In addition, the motors have a built-in electronic unit with a frequency converter for variable frequency and soft starting.

The MSE 3 motors features high efficiency within a wide load range. The high and flat efficiency curve of the PM motor enables the same motor to cover a wide power range as opposed to conventional AC motors. For BMQE pumps, this means fewer motor variants.

Diaphragm tank

The pre-charge pressure of the diaphragm tank must be set to 70 % of the pressure setting in order to use the tank to the limit of its capacity.

Use the values in the following table. Pre-charge pressure is measured with 0 psi in the pipeline.

Setting (psi)	Pre-charge pressure (psi)
40	28
50	35
60	42
70	49
80	56
90	63
100	70

Only a 2-gallon tank (Grundfos part number 91121984) is recommended in the BMQE system. Use of a different size tank will result in pressure fluctuations.

BMQE pump

BMQE motor

BMQE sleeve

TM05 0679 1411

Fig. 6 BMQE exploded view

Operating conditions

Flow:	Max. 39 US gpm (8.9 m ³ /h)
Head:	Max. 300 ft (91.4 m)
Liquid temperature:	Max. 95°F (35°C)
Operating pressure:	Max. 347 psi (23 bar)
Inlet pressure:	Min. 8 psi (0.55 bar)
Sound-pressure level:	The sound pressure level of the BMQE is lower than 74 db[A] at a distance of 3 ft (1 m).

Installation

Location of installation

The sound pressure level of the BMQE is <74 db[A] at a distance of 3 ft (1 m). It is recommended by Grundfos that the pump be installed with sound and vibration dampening equipment (flexible piping adapters and anti-vibration mounting — not sold by Grundfos).

Like most mechanical equipment, this system can create noises and vibrations. Grundfos recommends that the BMQE pump should not be mounted in or adjacent to living quarters.

Positioning the pump

The GRUNDFOS BMQE pump is supplied with a built-in non-return valve. An arrow on the BMQE sleeve shows the direction of liquid flow through the pump (fig. 7).

The BMQE is suitable for both vertical and horizontal installation; however, the discharge port should never fall below the horizontal plane. See fig. 8.

The BMQE must be installed with the air relief vent in the 12 o'clock position when installed horizontally and when installed in the vertical position, the air vent must be at the top of the unit.

Fig. 7 Arrow showing direction of liquid flow through pump

Fig. 8 Installation positions

Controller installation

All BMQE pumps can be connected to BMQE controllers. Each BMQE pump must be connected to its own BMQE controller.

Fig. 9 BMQE controller entry ports

Connection of motor

The BMQE incorporates a starter device and can therefore be connected directly to the main power supply. The BMQE incorporates thermal overload protection and requires no additional motor protection.

Cable installation

In situations where multiple BMQE power cables are run parallel in wiring trays or conduit and less than 12 inches apart, the possibility for undesired communication between units exists. When this occurs, intermittent or continuous NO CONTACT is typically seen. Other unexpected errors may also be seen.

The chart shows single-phase 60 Hz maximum cable length motor service to entrance. The maximum cable length with one BMQE controller is 650 ft (198.1 m); the maximum wire size is 10 AWG.

Maximum cable length (one controller)				
Motor rating		Copper wire size (AWG)		
Volts	Hp	14	12	10
Maximum cable length [ft (m)]				
115	0.50	100 (30.5)	160 (48.8)	250 (76.2)
	0.50	400 (121.9)	650 (198.1)	650 (198.1)
230	0.75	300 (91.4)	480 (146.3)	650 (198.1)
	1.0	250 (76.2)	400 (121.9)	630 (192)

TM01 7841 1511

TM04 9411 4110

TM04 1375

BMQE pumps connected in parallel

When connecting BMQE pumps in parallel (fig. 10) a separate BMQE controller must be used on each BMQE pump.

Set the pressure on one BMQE 10 psi lower than the other.

For BMQE pumps connected in parallel, mount one above the other; it is recommended to connect the pipes as shown in fig. 10. This layout ensures that the BMQE pumps are filled with water before starting.

TM04 9413 4 110

Fig. 10 Booster unit with two BMQE pumps connected in parallel, mounted one above the other

Additional considerations when connecting in parallel:

- All BMQE modules are supplied with a non-return valve.
- BMQE modules connected in parallel may also be installed vertically.
- As venting problems may arise in such installations, it is advisable to install suitable air vent devices.
- The BMQE should be positioned with the discharge and air vent at the top when installed vertically.
- When the maximum flow for BMQE pumps in parallel will exceed 35 gpm, a 4-gallon or two 2-gallon diaphragm tank(s) should be used.

Pressure sensor installation

The BMQE controller keeps the pressure constant in the place where the pressure sensor is positioned.

The maximum shielded cable length for the sensor must not exceed 1600 ft (487.7 m).

Generator operation

Power may be supplied to BMQE pumps by an adequately sized generator. The generator must be sized 50 % above the pumps P1 (input power) values.

Motor Hp	Minimum generator size [watts]	Recommended generator output [watts]
0.33 to 0.50 A	1100	1500
0.50 to 0.75 B	1700	2300
1.0 to 1.5 B	2000	3500

Quick selection guide

Example:

- The maximum demand is 15 gpm (3.4 m³/h).
- The pressure required is 70 psi (4.8 bar) system pressure at the taps in the building.
- The normal minimum inlet pressure (e.g. city pressure) is 20 psi (1.4 bar)
- The additional boost required is 50 psi (3.5 bar) at 15 gpm (3.4 m³/h).
- Select a 15 BMQE 05A-110.

Additional (boost) pressure required [psi]	Flow required [gpm]							
	5	10	15	20	25	30	35	39
90								
80		15 BMQE 07B-180

Technical data, BMQE pump

Main power supply to pump	1 x 200-240 V –10 % / +6 %, 60 Hz 1 x 110-115 V –10 % / +6 %, 60 Hz
Starting	Soft starting. The motor starting current is equal to the highest value stated on the BMQE nameplate.
Stopping	Soft stopping when stopped by the BMQE controller
Run-up time	Maximum: 2 seconds. No limitation to the number of starts/stops per hour.
Motor protection	Built into the pump. Protection against: <ul style="list-style-type: none"> • Dry running • Over voltage and under voltage 230 V cuts out at < 150 V and > 280 V 115 V cuts out at < 75 V and > 150 V • Overload • Over temperature
Sound pressure level	The sound pressure level is < 74 db[A] at a distance of 3 feet (1 meter). It is recommended by Grundfos that the pump be installed with sound and vibration dampening equipment such as flexible piping adapters and anti-vibration mounting.* The pump should not be mounted in or adjacent to living quarters. The pump can also be wrapped with sound proofing insulation to reduce noise.*
Reset function	BMQE pumps can be reset via BMQE controller
Power factor	PF = 1.
Operation via generator	It is recommended that the generator output is equal to the motor input power P1 [kW] plus 50 %; min. P1 +10 %, however.
Pipe connection	1.25" NPT inlet / 1" NPT discharge
Strainer	Holes of the strainer: ø0.09" (2.3 mm)
Approvals	UL Listed, CE (SQE Pump with MSE 3 motor only)
Weight	31 lbs. (14.1 kg)
Voltage	1 x 100-240 V –10 % / +6 %, 60 Hz

* Not sold by Grundfos.

Technical data, BMQE controller

Voltage	1 x 100-240 V -10 % / +6 %, 60 Hz
Power consumption	5 W
Current consumption	Maximum 130 mA
Motor cable	<ul style="list-style-type: none"> • 2-wire w/ground, 12 AWG Teflon • B: Black (Line, Neutral) • G: Green (Ground)
Enclosure class	NEMA 3R (IP 55)
Ambient temperature	In operation: -22 to +122 °F (-30 to +50 °C). During storage: -22 to +140 °F (-30 to +60 °C)
Relative air humidity	95 %
Pump cable	Maximum length between BMQE controller and pump: 650 ft (198 m)
Back-up fuse	Maximum: 16 A
Load	Max. 100 mA
Approvals	UL Listed, CE

3. MQ

Product introduction

The Grundfos MQ is a compact pump and pressure boosting unit, purpose-designed for domestic water supply and other applications where a compact and reliable, easy-to-install pump is advantageous. The MQ is a self-priming multistage centrifugal pump; it self-priming from a well depth of down to 26 ft (8 m) within 5 minutes.

The MQ is a complete, all-in-one unit, incorporating pump, motor, diaphragm tank, pressure and flow sensor, controller and check valve.

TMO1 9873

Fig. 15 Grundfos MQ

Applications

MQ is suitable for pressure boosting of potable water and rain water for:

- water pressure boosting
(max. inlet pressure 40 psi (2.8 bar))
- water supply from wells
(max. suction lift: 26 ft (8 m)).

Examples of ideal applications for MQ are:

- private homes
- farms
- market gardens and other large gardens.

Pumped liquids

The MQ is suitable for pumping potable water, rain water, or other clean, thin, non-aggressive liquids not containing solid particles or fibers.

Features and benefits

Complete system

The MQ is a compact, "plug and pump" or all-in-one solution; there is no need for a separate pressure tank, pressure switch, electrical connections, fittings, or any other separate items. No maintenance of the pump is required. Two versions are available to choose from.

Installation

Installation of the MQ is simple and can be done in a matter of minutes, which means greatly reduced installation costs.

Outlet connection can be angled up to 5° to fit existing pipework.

Simple operation

The MQ features a user-friendly control panel with ON/OFF button and indicator lights for indication of the operational state of the pump.

Compact design

Compact, horizontal design fits even where space is limited (outdoor applications require the use of the Protection Cover, sold separately); no space around the pump is required.

Self-priming

As it is self-priming, the MQ is able to pump water from a level below the pump. Provided it is filled with water, the pump is able to lift water from a depth of 26 ft (8 m) in less than 5 minutes. This facilitates installation and start-up of the pump and provides more reliable water supply in installations where there is a risk of dry running and leakages in suction hose or pipes.

Built-in protective functions

Built-in protective functions; if exposed to dry running, excessive temperature, or any overload condition the pump will stop automatically, thus preventing a motor burnout.

Automatic reset

In case of dry running or a similar alarm, the pump will stop. Restarting will be attempted every 30 minutes for a period of 24 hours. The reset function can be deactivated.

Low noise level

Superior hydraulics and internal cooling combined result in very quiet operation, which makes it suitable for many applications.

Pressure tank

The built-in pressure tank reduces the number of starts and stops in case of leakages in the pipe system, causing less wear on the pump.

How the MQ functions

The MQ pump has a small built-in pressure tank, sufficient to ensure that water is readily available from the tap. When water is required, the pump automatically starts. A non-return valve prevents backflow.

The controller ensures that the pump starts automatically when water is consumed and stops automatically when the consumption ceases. In addition, the controller protects the pump in case of faults.

Operating conditions

System pressure:	Max. 109 psi (7.5 bar)
Inlet pressure:	Max. 40 psi (2.8 bar)
Suction lift:	Max. 26 ft (8 m)
Liquid temperature:	32°F to +95°F (0°C to +35°C)
Ambient temperature:	32°F to +113°F (0°C to +45°C)

Installation

Location

The pump is suitable for indoor and outdoor installation. It is resistant to sunlight. For outdoor installation, the pump must be fitted with a protective cover (accessory). Should the unlikely event of an internal leakage occur, pumped liquid will be drained out from the base and/or end cover instead of damaging the pump. Install the pump in such a way that no undesirable collateral damage can arise.

Positioning the pump

Mount the pump on the base plate with horizontal suction port and vertical discharge port.

The pump must be installed horizontally.

The maximum permissible inclination angle is +/- 18 °.

To prevent movement and vibrations, the pump and base plate can be secured to a solid foundation by means of the bolt holes in the base plate.

Selection of product

MQ is available in two sizes and two voltages.

Model	Voltage [V]	Product number
MQ 3-35	115	96860172

4. JP Jet Pumps

Product introduction

The Grundfos JP line of self-priming centrifugal jet pumps is designed for shallow well, deep well, and convertible shallow well pump applications.

JP pumps provide excellent suction capacity.

Fig. 19 Grundfos JP line (from left to right: JP shallow well; JP deep well; and JP convertible shallow well)

Applications

Grundfos JP pumps are particularly suitable for:

- domestic water supply systems
- light agricultural
- industrial water transfer
- home and market gardens.

Features and benefits

Shallow well - cast iron

JP05S-CI, JP07S-CI, JP10S-CI, JP30S-CI

Single-stage, shallow well self-priming centrifugal pumps. Features:

- Rugged cast iron construction
- end suction, top discharge arrangement
- technopolymer impeller
- built-in ejector complete with clean-out port to clear blockages from nozzle
- convenient priming plug for ease of priming and air elimination
- ceramic-carbon bellows mechanical seal ensures trouble-free operation
- high quality pressure switch.

Shallow well convertible - cast iron

JP15S-CI, JP20S-CI

Single stage, convertible, self-priming centrifugal pumps. Features:

- Rugged cast iron construction
- end suction, top discharge arrangement
- detachable ejector assembly for deep well applications

- technopolymer impeller
- convenient priming plug for ease of priming and air elimination
- ceramic-carbon bellows mechanical seal ensures trouble-free operation
- high quality pressure switch.

Deep well - cast iron

JP05D-CI, JP07D-CI, JP15D-CI, JP20D-CI

Single-stage, deep well, self-priming centrifugal pumps. Features:

- Rugged cast iron construction
- end suction, top discharge arrangement
- technopolymer impeller
- separate deep well port for connection to Deep Well Ejector Kit
- convenient priming plug for ease of priming and air elimination
- ceramic-carbon bellows mechanical seal ensures trouble-free operation
- high quality pressure switch.

Shallow well - stainless steel

JP05S-SS, JP07S-SS, JP10S-SS

Single-stage, shallow well self-priming centrifugal pumps constructed of stainless steel. Features:

- Corrosion-resistant stainless steel
- end suction, top discharge arrangement
- technopolymer impeller
- built-in ejector complete with clean-out port to clear blockages from nozzle
- ceramic-carbon bellows mechanical seal ensures trouble-free operation
- high quality pressure switch.

Motors

All Grundfos JP motors are Totally Enclosed and Fan-Cooled (TEFC) for quiet operation and superior protection in harsh environments. Features:

- Stainless steel motor shaft offers excellent corrosion resistance
- Double, oversized grease ball bearings are maintenance-free; sealed for life
- Built-in thermal overload protection
- Capacitor-run, with no switches to fail
- Drive end motor bearing protected by durable lip seal
- Insulation class F
- Motor protection IP44
- Terminal box protection IP55.

E30 NPT	96654384

Installation

Pump location

The pump must be located in a well-ventilated place, protected from unfavorable weather conditions and with an environmental temperature not exceeding 104 °F (40 °C).

It is always good practice to place the pump as close as possible to the liquid to be pumped.

Pump position

Allowable positions

Fig. 20 Pump must be installed in horizontal position only

The pump must be installed only in horizontal position. To prevent movement and vibrations, anchor the pump firmly to a horizontal surface.

Note: Refer to pump nameplate.

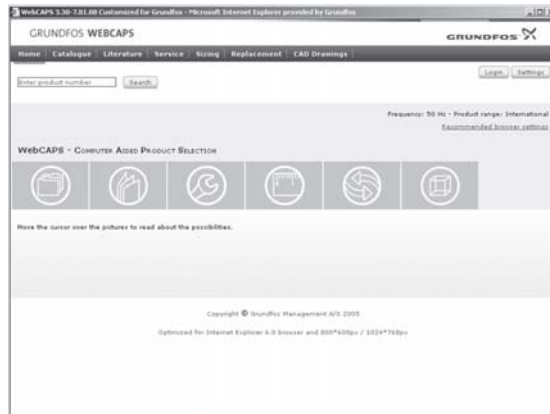

Approvals

Subject to alterations.

5. Further documentation

WebCAPS

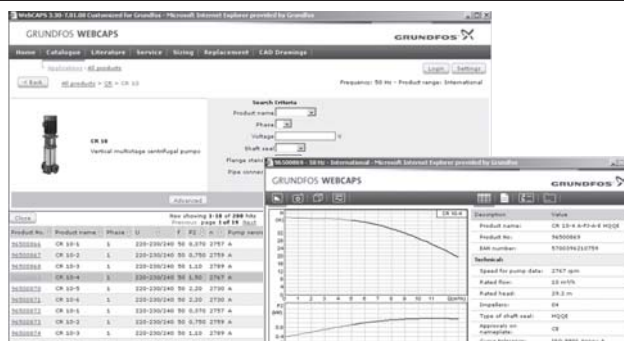

WebCAPS is a **Web-based Computer Aided Product Selection** program available on www.grundfos.com.

WebCAPS contains detailed information on more than 185,000 Grundfos products in more than 20 languages.

In WebCAPS, all information is divided into 6 sections:

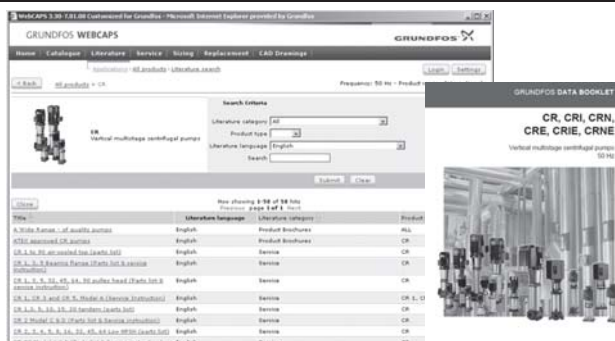

- Catalog
- Literature
- Service
- Sizing
- Replacement
- CAD drawings.

Catalog

This section is based on fields of application and pump types, and contains

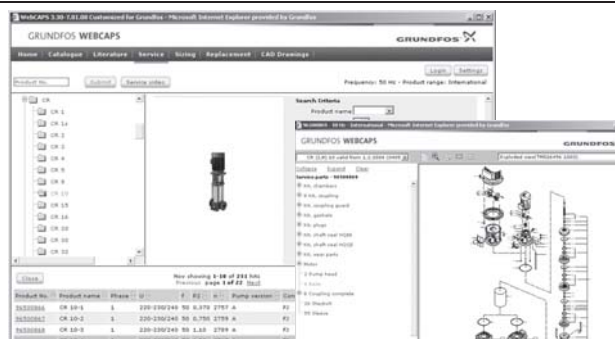

- technical data
- curves (QH, Eta, P1, P2, etc) which can be adapted to the density and viscosity of the pumped liquid and show the number of pumps in operation
- product photos
- dimensional drawings
- wiring diagrams
- quotation texts, etc.

Literature

In this section you can access all the latest documents of a given pump, such as

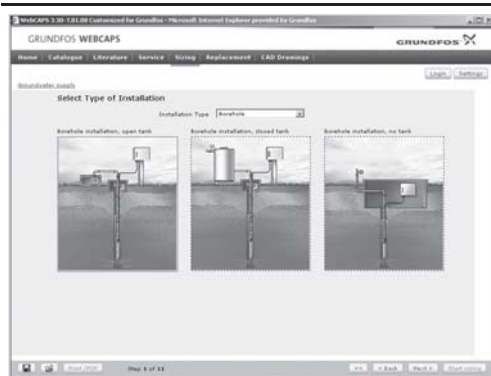

- product guides
- installation and operating instructions
- service documentation, such as Service kit catalog and Service kit instructions
- quick guides
- product brochures, etc.

Service

This section contains an easy-to-use interactive service catalog. Here you can find and identify service parts of both existing and discontinued Grundfos pumps.

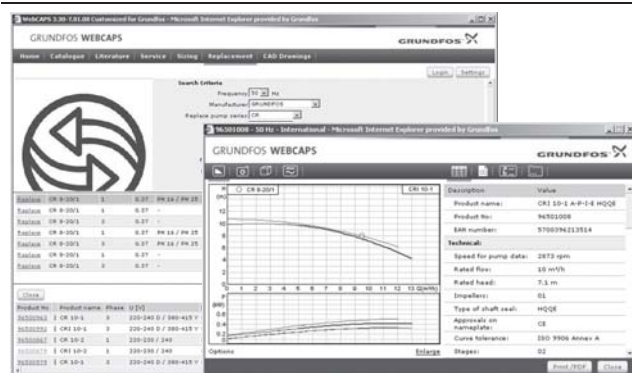

Furthermore, this section contains service videos showing you how to replace service parts.

Sizing

This section is based on different fields of application and installation examples, and gives easy step-by-step instructions in how to

- select the most suitable and efficient pump for your installation
- carry out advanced calculations based on energy consumption, payback periods, load profiles, life cycle costs, etc.
- analyze your selected pump via the built-in life cycle cost tool
- determine the flow velocity in wastewater applications, etc.

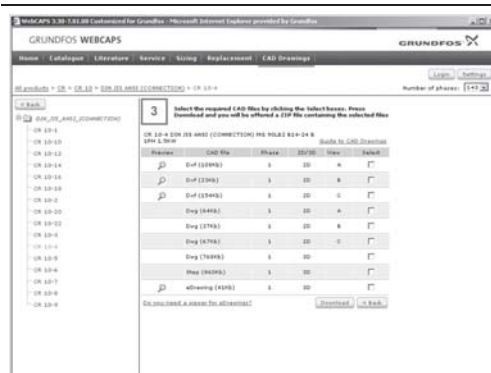

Replacement

In this section you find a guide to selecting and comparing replacement data of an installed pump in order to replace the pump with a more efficient Grundfos pump.

The section contains replacement data of a wide range of pumps produced by other manufacturers than Grundfos.

Based on an easy step-by-step guide, you can compare Grundfos pumps with the one you have installed on your site. When you have specified the installed pump, the guide will suggest a number of Grundfos pumps which can improve both comfort and efficiency.

CAD drawings

In this section it is possible to download 2-dimensional (2D) and 3-dimensional (3D) CAD drawings of most Grundfos pumps.

These formats are available in WebCAPS:

2-dimensional drawings:

- .dxf, wireframe drawings
- .dwg, wireframe drawings.

3-dimensional drawings:

- .dwg, wireframe drawings (without surfaces)
- .stp, solid drawings (with surfaces)
- .eprt, E-drawings.

WinCAPS

Fig. 21 WinCAPS CD-ROM

WinCAPS is a **Windows-based Computer Aided Product Selection** program containing detailed information on more than 185,000 Grundfos products in more than 20 languages.

The program contains the same features and functions as WebCAPS, but is an ideal solution if no Internet connection is available.

WinCAPS is available on CD-ROM and updated once a year.
